**Dear doctor,**

Epilepsy is a common neurological disorder that is often poorly controlled due to ineffective medications, side effects, and poor treatment adherence. Treatment-resistant epileptic syndromes, such as Lennox-Gastaut syndrome, Dravet syndrome, and Tuberous sclerosis complex pose significant clinical challenges. Therefore, newer treatment options are needed.

Cannabidiol (CBD), derived from cannabis has shown safety and efficacy in managing refractory epilepsy, especially in children. It is approved by the USFDA and DCGI for treating seizures associated with LGS, DS, and TSC in patients ranging from 1 year of age and older.

We cordially invite you to this **CME meeting** to discuss about the

## Role of Cannabidiol in Neurology
